

5 WAYS YOU CAN AVOID MID-AIR COLLISIONS

1. Use an iPad with ADS-B or traffic systems so you know where to look outside.

- Never look down at an iPad or display for more than 2 seconds or rely on them, use them to know where to look!

2. Clean your windshield before every flight

- Water and microfiber towels are the best. Window cleaners and paper towels can cause scratches and make it harder to find traffic

3. Fly IFR or at least get VFR flight following on every flight.

4. Enter non-towered airports on the 45

- Cross mid field 1000' above traffic pattern to look for airplanes in the pattern and then enter on a 45 degree angle to downwind. Remember other people flying at that airport may not even have a radio!

5. Fly with LED lights on 24 hours a day below 10,000 feet.

- BE SEEN AND AVOIDED - The best way to prevent mid-air is to make it easier for other pilots to see you!
- That's why the PilotSafety.org airplane has lights from www.AeroLEDS.com that are much brighter than the old halogen lights use less electricity and last for years.
